

ABSTRACT OF THE DISCLOSURE

A system for treatment of infectious waste including an impactor coupled to a mixing drum that can be pressurized. Infectious waste is introduced directly into the impactor, where the waste is pulverized, then introduced into the mixing drum through its inlet end for mixing with a treatment fluid effective to kill pathogenic organisms. The drum is sealed, and superatmospheric pressure is applied therein to drive the treatment chemicals into the waste particles. After treatment, the treated waste and treatment chemicals are discharged from the drum through the inlet end of the mixing drum.
